PRODUCTION BY VARIETIES

1956

WITH COMPARISONS X

The 1956 commercial apple crop of 97,077,000 bushels was 9 percent smaller than production in 1955 and was almost the same percentage below the 1945-54 average. The season was characterized by a short crop (23 percent below average) in the Western States, by nearly average production in the Eastern States, and by a larger supply (12 percent above average) in the Central States.

Variety-wise, the supply of winter varieties was closer to average than the supply of fall or summer varieties, but in relation to 1955, the 1956 production of winter varieties was relatively smaller than fall or summer varieties.

Winter varieties, which constitute about four-fifths of total production, showed 11 percent less production than in 1955 and 7 percent less than average. Largely responsible for this reduction were the decreases in Delicious, McIntosh, Rome Beauty, Stayman, Cortland, and Rhode Island Greening varieties. The Delicious variety continued to maintain its position as the leading apple variety in the United States despite a reduction of 22 percent below production in 1955. This variety, estimated at 18.9 million bushels, accounted for nearly one-fourth of the total production of winter varieties in 1956. McIntosh, the second ranking U. S. variety, was 32 percent under the 1955 supply but, at 10.2 million bushels, accounted for nearly 13 percent of the supply of winter varieties. Rome Beauty, at 6.6 million bushels, Stayman, at 4.5 millions, Cortland, at 2.4 millions, and Rhode Island Greening, at 1.5 millions, were also considerably shorter in supply this year than last. Offsetting to some extent the shorter supplies of Delicious, McIntosh, Rome Beauty, Stayman, Cortland, and Rhode Island Greening were increases over 1955 in production of the Winesap, York Imperial, Yellow Newtown, Golden Delicious, Baldwin, and Northern Spy varieties. Production of Winesaps, at 9.4 million bushels, accounted for nearly 12 percent of the supply of winter varieties and kept this variety in third place among the country's apple varieties. The York Imperial crop, at 6.3 million bushels, was considerably larger than both the 1955 and average crops. Golden Delicious, at 4.2 millions, and Northern Spy, at 2.7 millions, also considerably exceeded the 1955 and average supplies. Yellow Newtown, at 4.4 millions, and Baldwin, at 3.0 millions, were above 1955 but were smaller than average in production.

Production of fall varieties, though 4 percent larger than in 1955, was 16 percent below average. Each of the three leading fall varieties--Jonathan, at 6.9 million bushels, Grimes Golden, at 1.5 millions, and Wealthy, at 1.5 millions--was below average.

Summer varieties were only 1 percent below 1955 but were 10 percent less than the average. The Gravenstein, at 2.6 million bushels, was the leading summer variety. Production of this variety was considerably smaller than in 1955 and was also below average.

Washington, D. C.
December 1956
